### ***Specification***

The abstract of the disclosure is objected to because it should be provided on a separate sheet. Correction is required. See MPEP § 608.01(b).

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 9-19 are rejected under 35 U.S.C. 102(b) as being anticipated by Cock (EP 0878,667) cited by the Applicant. Cock (EP'667) shows a cycling of a heating element 4 in a baking oven (Figure 1) having oven temperature sensor 12 and an exhausted fumes duct 7 provided with catalyst temperature sensor 15, in which the heating element is controlled by an electronic controller 13 which receives signals from the catalytic temperature sensor 15 at an oxidation catalyst 11 and from the oven temperature sensor 12, wherein when the oven temperature initially rises and volatile substances are vaporized, resulting in an exothermic reaction at the catalyst 11, the heating element 4 is switched off (i.e., at least at a first control state being reached when the catalyst temperature is higher than an oven chamber temperature), and when a substantial amount of the volatile soil has been evaporated with the catalyst temperature fall, the controller 13 switches the heating element 4 back on with the self-cleaning operation also is terminated as the fixed temperature in the oven having been reached or a fixed temperature differential between the catalyst temperature and the oven temperature having been achieved (i.e., oven chamber temperature is maintained substantially constant as the control state being reached when the temperature difference between the catalyst temperature and the oven chamber temperature is at least greater than or equal to a threshold value). The controller 3 is continuously controlling the cycling of the heating element 4 at different control states during baking and self-cleaning operations.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure: Boehm (DE 102 46 498 A1) discloses the exact temperature regulation of baking oven with involves processing signals of baking oven catalyst temperature sensors.
